Re: Senior Principal Technical Program Manager · Data Center Expansion · OCI

Dear Hiring Manager,

I led OCI's Fiber Supply Remediation Program from January to March 2026. That program was the SWAT-style high-priority delivery this role describes: parachuting into a bottleneck blocking hyperscale data center builds, identifying the constraint (single-supplier concentration risk), and driving cross-functional alignment across supply chain, DC design, hardware order management, demand planning, and Stargate DC delivery. Outcome: qualified supplier base expanded from three to seven vendors, with a recurring demand-supply alignment cadence in place to keep critical DC builds on schedule.

I left OCI in March because I was looking for broader impact across compute, storage, and network infrastructure than I had on the fiber-supply dimension at the time. This Senior Principal TPM role on the data center SWAT team is exactly that scope expansion. Same operating pattern of high-priority, ambiguous, executive-visible delivery, now across the full data center stack OCI is scaling.

The twelve years before OCI were in Apple infrastructure. I led multi-year programs across compute, storage, network, on-prem cloud, big data, and high-security environments. Managed capital budgets exceeding \$20M, consolidated 400+ applications from third-party data centers into Apple-owned facilities, and established PCI-compliant High-Secure Environments for retail and payments workloads. The cross-functional partners on those programs were the same kind of stack this role coordinates: Network Engineering, Platform/Cloud SRE, Database Engineering, Storage Engineering, DC Operations.

I also built the PMO automation tooling that drove a 50% efficiency gain in program tracking, including executive-level reporting mechanisms aligned with what this role calls out under "program governance, risk management frameworks, and reporting mechanisms."

What I bring back to OCI: familiarity with the operating model from the inside, a recent SWAT-style proof point on the Fiber program, and the broader DC infrastructure breadth from Apple that I want to apply at OCI scale. Returning to OCI in this expanded scope is the move I want to make.

I'd like to talk about the role and what the team is delivering.

Best,

Rajesh Ramani
